Chapter 10 The Emotional Approach: Mind as Emotion

Terms to Know (bolded most important) ~

- Affect
- Arousal
- Cognition
- Autobiological memory
- Episodic memory
- Semantic memory
- Visual search paradigm

-Skip psychological disorders and the chemical & electrical basis of emotion

-No questions on emotion & decision-making or reasoning & analogy except what is covered in class

People to recognize:

- Darwin
- Ekman

Also, see bolded words below.

In More Detail, Be able to ~

1. Elaborate on what we mean when we say, "cognition and emotion are complexly intertwined."
2. Distinguish **emotions** (brief, autonomic behavioral change), **feelings** (internal subjective experience of emotion), and **moods** (diffuse, affective, lower intensity, but longer lasting experiences).
3. List and clarify the three characteristics of emotions, 1) **embodied**, 2) harder to control, and 3) less **encapsulated**.
4. Compare and contrast the **James-Lange theory** and the **Cannon-Bard theory** of emotion. and the **Emergence Synthesis Approach**.
5. Outline the Schachter and Singer (1962) experiment illustrating the role of **cognitive appraisal** (i.e., interpretation of the environment and situation) in the **cognitive theory** of emotion.
6. Explain how the **emergence synthesis approach** incorporates the three previous approaches (James-Lange, Cannon-Bard, & Cognitive Theory) can lead to several pathways, including arousal, interpretation, or a combination.
7. Define a **basic emotion** (mostly innate, universal, can be combined into more complex emotions) and list Ekman's six basic emotional facial expressions (happy, sad, fearful, angry, surprised, disgusted).
8. Recognize the possible evolutionary, adaptive purpose of emotions, such as **survival**, reflexive quick action → cognition (what to do?), **communication** (sharing feelings with others), and **cognition** (making decisions).
9. Review the characteristics of happiness, its survival value, and the **feel-good, do-good phenomenon**.
10. Identify brain regions involved in the processing of emotions, including the **amygdala**, **thalamus**, and **cortex**.
11. Discuss the role of emotion in **perception** and **attention** (facilitation / interference, color) for example:
    - Facilitation in perception / attention: Faster at detecting angry faces (**Threat-superiority effect**) and faster detecting orientation of fearful faces, perceive larger physical size in successful terrorists
    - Interference in perception/ attention: interference from negative social information (e.g., more time to name color of negative word than positive word).
12. Discuss the role of emotion in memory:
    - Discuss **flashbulb memories** (detailed memories for emotional charged events) for the World Trade Center (attack on 9/11) and compare flashbulb memories to other types of memories as far as accuracy and confidence people feel about the memory.

- Explain the improvement in memory for negative stimuli rather than positive stimuli, since we may allocate more attention to negative items, negative events may be more distinct/unusual, and we may think about and rehearse negative memories more often.
- Discuss **mood-congruent memory** and why **mood dependent memory** recall is better when our mood at encoding matches our mood at recall.

13. Explain the difference between **emotional** (intuitive decision making) and **rational** (calculated) decision making)
    - Review the two information processing strategies, **assimilation/ assimilation** with **accommodation / accommodate** that we might use while in different moods.
14. Briefly review and describe artificial intelligence research in the field of **affective computing** and the **Kismet project**.
